COMPETITOR TEST

N°1 STOPPING DISTANCE

FERODO YOU'RE IN CONTROL

METRES AHEAD OF THE COMPETITION

Our recent tests conducted on a Ford C-MAX at the Nardo proving ground, against other brands proved the myth. The tests were carried out according to Regulation 90 requirements - at a speed of 100 km/h (62 mph) of the maximum vehicle speed, and at 80 km/h in both vehicle and significantly less the stopping distance of most alternative competitors.

At high speeds, or highway driving, brake performance plays a major role in both vehicle and driver safety. Stopping in time allows you to avoid dangerous road accidents, and the distance you travel before reaching a complete stop can make the difference between life and death. At 100 km/h the best performance was achieved by a range of 4 metres. Further away than the Ferodo 100 km/h the best performance was achieved by a range of 4 metres.

At 80 km/h the best performance was achieved by a range of 2.5 metres. Further away than the Ferodo 80 km/h the best performance was achieved by a range of 2.5 metres.

For the safety, brake performance and stopping power, choose Ferodo OE-quality brake pads.

AVOIDING NOISE PROBLEMS TIPS FOR CORRECT ASSEMBLY

The easiest way to avoid problems is to ensure that the brake pads and caliper are correctly assembled from the start. Following these simple instructions for assembly, should help avoid vibrations and the associated noise, and allow for a smooth comfortable ride.

Strip and clean all the caliper slides and pins.

Always paper can be used only on the caliper and pad attachment to the rear of the hub or pin.

Check for the correct lubrication to ensure free movement and that the air does not enter into the caliper to help reduce noise.

Check for the correct pin position, and adjust the piston fully. This is essential to avoid damage to the pin or the rubber seal.

Check that the brake pads fit freely and easily into the caliper brackets.

AUDI V0-1

Challenge:
As the suspension systems on new cars become ever more complex it has been necessary to follow in their intricate and complicated chassis designs which in turn has led to a huge increase in the numbers required for the aftermarket. EASY SOLUTIONS BULLETIN

MERCEDES SPRINTER VW LT AMGK7455

Challenge:

- Ball joints experience premature wear, especially in harsh (base) environments. CE ball joint uses a plastic bearing design with a 3.12 cm ball and self-aligning design for vehicles of this size a larger ball stud diameter should be used to improve load-carrying capability and to detect the deformation and wear which occurs at present.
- The CE ball joint uses a very shallow stud taper in combination with a very high stud nut torque specification of 23.7 Nm. This pulls the stud with extreme force, locking it into the knuckle, displacing the ball joint stud from the knuckle can prove difficult.

MOOG Easy Solution:

In this case the ball joint housing outside diameter is too small to oversize the ball stud. To gain strength and wear resistance, MOOG solution heat-treats the ball stud and housing. Access lubrication at the bearing surface.

- The hardened powdered-metal will not deform under the bearing load, and the porous material allows lubrication at the bearing surface.
- A premium polyurethane boot is used, providing a sealed part able to flush contamination.
