FERODO YOU'RE IN CONTROL
AVOIDING NOISE PROBLEMS
TIPS FOR CORRECT ASSEMBLY
TECHNICAL TIPS

The easiest way to avoid problems is to ensure that the brake pads and caliper are correctly assembled from the start. Following these simple instructions for assembly, should help avoid vibrations and the associated noise, and allow them a smooth comfortable ride.

- Strip and clean all the caliper slides and pins.
- Every pin must have the correct lubrication to ensure free movement and that the pin does not vibrate into the caliper to stop make noise.
- Check for free piston movement, and check the piston fully. This is essential to avoid damage to the pin or the rubber seal.
- Check that the brake pads fit freely and easily into the caliper brackets.

EASY SOLUTIONS BULLETIN

AUDI

Challenge:
As the suspension systems on new cars become ever more complex it has been necessary to follow in their intricate and complicated chassis designs which in turn has led to a huge increase in the numbers required for the aftermarket.
The multi-link suspension systems on AUDI's mid- to high-range vehicles is complex and includes 4 arms/subframe link bars. To match and replace individual parts can be difficult and time consuming. MOOG's multi-link suspension repair kits with great features for workshops and drivers.

MOOG Easy Solution:

- This one kit enables the most important front axle suspension components to be replaced with fewer, preferably, worn components required.
- Easy and efficient solution that improves driver safety and vehicle performance.
- Top product quality backed by a 3 year warranty.
- Fast and order one part instead of multiple units.
- Keeps the workshop tidy and organised.
- Improves vehicle steering and suspension performance.
- Decreases potential vehicle (lean-back) only one repair needed.
- Decreases overall cost of labour for the driver.

EASY SOLUTIONS BULLETIN

MERCEDES SPRINTER VW LT

Challenge:

- Ball joints experience premature wear, especially in harsh (base) environments. CE ball joint uses a plastic bearing design with a 3.12 cm ball and self diameter - for vehicles of this size a larger ball stud diameter should be used to improve load-carrying capability, and to limit the deformation and wear which occurs at present.
- The CE ball joint uses a very shallow stud taper in combination with a very high stud nut torque specification of 23.7 Nm. This pulls the stud with extreme force, locking it into the knuckle, displacing the ball joint stud from the knuckle can prove difficult.

MOOG Easy Solution:

In this case the ball joint housing outside diameter is too small to oversize the ball stud to gain strength and wear resistance. MOOG solution heat-treats the ball stud and housing across the diameter at the bearing surface.

- The hardened powdered-metal will not deform under the bearing load, and the porous material allows lubrication at the bearing surface.
- A premium polyurethane boot is used, providing a sealed part able to flush contamination.
